@Turninglives

Contemporary “face upsampling” systems just do this. If one tra
algorithms with images of white males, algorithms produce imag
white males. That’s how they work.

Ada Lovelace @AdaLovelace Feb 24
Replying to @Turinglives
This is an example about something more important: The hidden dan
our algorithms. The hidden biases of our algorithms. Would you want
algorithms like these to decide, who gets a job, gets arrested or pass
security check-in at airports? I don’t.

1

Turninglives @Turninglives Feb 24
That’s how these systems work, guys. These algorithms produce bia
results, if they are trained with biased data. Face upsampling system
everyone look white males, if they are trained with the datasets of w

Eugene @EugeneG · Feb 24
But that’s not the problem, man. It really isn’t about datasets, it is al
whole machine learning industry. Don’t reduce harms caused by this
to dataset bias

1

Turninglives @TuringlivesFeb 24
Well, I didn’t. All I said is: If we use biased datasets, then we’ll have
results. That’s why researchers need to be more careful selecting th
so that they don't accidentally encode biases like this. And, it is one

1

GÖDEL'S GHOST @GoedelsGhost Feb 24
Users get their applications from the engineers, the engineers get th
methods from computer scientists. At least computer scientists shou
recognize how biased their methods are. And tell it.

1

Turninglives @Turninglives Feb 24
“Yes, I agree. But isn’t it one thing to do research on these things, a
another to deploy them in practice? The consequences of bias are m
problematic, when they are in a deployed product than in an academ
Don’t bark up the wrong tree

1

The man in the Chinese Ro @chineseroomguyFeb 24
So, you basically say: Researchers might acknowledge their data is
use it anyway because it's there, and then say ‘it's acceptable becau
just an academic experiment and I am not responsible, if someone u
a way that causes harm?’ Is that your answer?

1

Turninglives @Turninglives Feb 24
Well, yes and no. Isn’t there a difference between basic research and
applications in real world tasks? Think about physicists. Are physicist
responsible for nuclear weaponry? Or, are biologists studying genes
responsible for eugenics? Isn’t this precisely the same question? Can
judge basic research, because there can be bad applications? And st
